# WEAKLY Z-SYMMETRIC MANIFOLDS

## CARLO ALBERTO MANTICA AND LUCA GUIDO MOLINARI

ABSTRACT. We introduce a new kind of Riemannian manifold that includes weakly-, pseudo- and pseudo projective- Ricci symmetric manifolds. The manifold is defined through a generalization of the so called Z tensor; it is named weakly Z-symmetric and denoted by  $(WZS)_n$ . If the Z tensor is singular we give conditions for the existence of a proper concircular vector. For non singular Z tensor, we study the closedness property of the associated covectors and give sufficient conditions for the existence of a proper concircular vector in the conformally harmonic case, and the general form of the Ricci tensor. For conformally flat  $(WZS)_n$  manifolds, we derive the local form of the metric tensor.

Date: May 2011.

## 1. INTRODUCTION

In 1993 Tamassy and Binh [31] introduced and studied a Riemannian manifold whose Ricci tensor satisfies the equation:

(1) 
$$\nabla_k R_{jl} = A_k R_{jl} + B_j R_{kl} + D_l R_{kj}.$$

The manifold is called weakly Ricci symmetric and denoted by  $(WRS)_n$ . The Ricci tensor and the scalar curvature are  $R_{kl} = -R_{mkl}{}^m$  and  $R = g^{ij}R_{ij}$ .  $\nabla_k$  is the covariant derivative with reference to the metric  $g_{kl}$ . We also put  $\|\eta\| = \sqrt{\eta^k \eta_k}$ . The covectors  $A_k$ ,  $B_k$  and  $D_k$  are the associated 1-forms. The same manifold with the 1-form  $A_k$  replaced by  $2A_k$  was studied by Chaki and Koley [6], and called generalized pseudo Ricci symmetric. The two structures extend pseudo Ricci symmetric manifolds,  $(PRS)_n$ , introduced by Chaki [4], where  $\nabla_k R_{jl} = 2A_k R_{jl} + A_j R_{kl} + A_l R_{kj}$  (this definition differs from that of R. Deszcz [17]).

Later on, other authors studied the manifolds [10, 20, 12]; in [12] some global properties of  $(WRS)_n$  were obtained, and the form of the Ricci tensor was found. In [10] generalized pseudo Ricci symmetric manifolds were considered, where the conformal curvature tensor

(2)  

$$C_{jkl}{}^{m} = R_{jkl}{}^{m} + \frac{1}{n-2} (\delta_{j}{}^{m}R_{kl} - \delta_{k}{}^{m}R_{jl} + R_{j}{}^{m}g_{kl} - R_{k}{}^{m}g_{jl}) - \frac{R}{(n-1)(n-2)} (\delta_{j}{}^{m}g_{kl} - \delta_{k}{}^{m}g_{jl})$$

vanishes (for n = 3:  $C_{jkl}^m = 0$  holds identically, [27]) and the existence of a proper concircular vector was proven. In [20] a quasi conformally flat  $(WRS)_n$  was studied, and again the existence of a proper concircular vector was proven.

Key words and phrases. Weakly-Ricci Symmetric manifolds, Pseudo- Projective Ricci symmetric, conformal curvature tensor, quasi conformal curvature tensor, conformally symmetric, conformally recurrent, Riemannian manifolds. Weakly Z symmetric Manifolds.

In [2]  $(PRS)_n$  with harmonic curvature tensor (i.e.  $\nabla_m R_{jkl}{}^m = 0$ ) or with harmonic conformal curvature tensor (i.e.  $\nabla_m C_{jkl}{}^m = 0$ ) were considered.

Chaki and Saha considered the projective Ricci tensor  $P_{kl}$ , obtained by a contraction of the projective curvature tensor  $P_{jkl}^m$  [18]:

(3) 
$$P_{kl} = \frac{n}{n-1} \left( R_{kl} - \frac{R}{n} g_{kl} \right),$$

and generalized  $(PRS)_n$  to manifolds such that

(4) 
$$\nabla_k P_{jl} = 2A_k P_{jl} + A_j P_{kl} + A_l P_{kj}.$$

The manifold is called *pseudo projective Ricci symmetric* and denoted by  $(PWRS)_n$ [8]. Recently another generalization of a  $(PRS)_n$  was considered in [5] and [11], whose Ricci tensor satisfies the condition

(5) 
$$\nabla_k R_{jl} = (A_k + B_k)R_{jl} + A_j R_{kl} + A_l R_{kj}$$

The manifold is called *almost pseudo Ricci symmetric* and denoted by  $A(PRS)_n$ . In ref.[11] the properties of conformally flat  $A(PRS)_n$  were studied, pointing out their importance in the theory of General Relativity.

It seems worthwhile to introduce and study a new manifold structure that includes  $(WRS)_n$ ,  $(PRS)_n$  and  $(PWRS)_n$  as special cases.

# **Definition 1.1.** A (0,2) symmetric tensor is a generalized Z tensor if

where  $\phi$  is an arbitrary scalar function. The Z scalar is  $Z = g^{kl} Z_{kl} = R + n\phi$ .

The classical Z tensor is obtained with the choice  $\phi = -\frac{1}{n}R$ . Hereafter we refer to the generalized Z tensor simply as the Z tensor.

The Z tensor allows us to reinterpret several well known structures on Riemannian manifolds.

1) If  $Z_{kl} = 0$  the (Z-flat) manifold is an Einstein space,  $R_{ij} = (R/n)g_{ij}$  [3].

2) If  $\nabla_i Z_{kl} = \lambda_i Z_{kl}$ , the (Z-recurrent) manifold is a generalized Ricci recurrent manifold [9, 26]: the condition is equivalent to  $\nabla_i R_{kl} = \lambda_i R_{kl} + (n-1) \mu_i g_{kl}$  where  $(n-1)\mu_i \equiv (\lambda_i - \nabla_i)\phi$ . If moreover  $0 = (\lambda_i - \nabla_i)\phi$ , a Ricci Recurrent manifold is recovered.

3) If  $\nabla_k Z_{jl} = \nabla_j Z_{kl}$  (i.e. Z is a Codazzi tensor, [16]) then  $\nabla_k R_{jl} - \nabla_j R_{kl} = (g_{kl}\nabla_j - g_{jl}\nabla_k)\phi$ . By transvecting with  $g^{jl}$  we get  $\nabla_k [R + 2(n-1)\phi] = 0$  and, finally,

$$\nabla_k R_{jl} - \nabla_j R_{kl} = \frac{1}{2(n-1)} (g_{jl} \nabla_k - g_{kl} \nabla_j) R.$$

This condition defines a *nearly conformally symmetric* manifold,  $(NCS)_n$ . The condition was introduced and studied by Roter [29]. Conversely a  $(NCS)_n$  has a Codazzi Z tensor if  $\nabla_k [R + 2(n-1)\phi] = 0$ .

4) Einstein's equations [14] with cosmological constant  $\Lambda$  and energy-stress tensor  $T_{kl}$  may be written as  $Z_{kl} = kT_{kl}$ , where  $\phi = -\frac{1}{2}R + \Lambda$ , and k is the gravitational constant. The Z tensor may be thought of as a generalized Einstein gravitational tensor with arbitrary scalar function  $\phi$ .

Conditions on the energy-momentum tensor determine constraints on the Z tensor: the vacuum solution Z = 0 determines an Einstein space with  $\Lambda = \frac{n-2}{2n} R$ ; conservation of total energy-momentum  $(\nabla^l T_{kl} = 0)$  gives  $\nabla^l Z_{kl} = 0$  and  $\nabla_k (\frac{1}{2}R + \phi) = 0$ ; the condition  $\nabla_i Z_{kl} = 0$  describes a space-time with conserved energy-momentum density.

Several cases accomodate in a new kind of Riemannian manifold:

**Definition 1.2.** A manifold is *Weakly Z-symmetric*, and denoted by  $(WZS)_n$ , if the generalized Z tensor satisfies the condition:

(7) 
$$\nabla_k Z_{jl} = A_k Z_{jl} + B_j Z_{kl} + D_l Z_{kj}.$$

If  $\phi = 0$  we recover a  $(WRS)_n$  and its particular case  $(PRS)_n$ . If  $\phi = -R/n$ (classical Z tensor) and if  $A_k$  is replaced by  $2A_k$ ,  $B_k = D_k = A_k$ , then  $Z_{jl} = \frac{n-1}{n}P_{jl}$ and the space reduces to a  $(PWRS)_n$ .

Different properties follow from the Z tensor being singular or not. Z is singular if the matrix equation  $Z_{ij}u^j = 0$  admits (locally) nontrivial solutions, i.e. Z cannot be inverted.

In sect.2 we obtain general properties of  $(WZS)_n$  that descend directly from the definition and strongly depend on  $Z_{ij}$  being singular or not. The two cases are examined in sections 3 and 4. In sect.3 we study  $(WZS)_n$  that are conformally or pseudo conformally harmonic with  $B-D \neq 0$ ; we show that B-D, after normalization, is a proper concircular vector. Sect.4 is devoted to  $(WZS)_n$  with non-singular Z tensor, and gives conditions for the closedness of the 1-form A - B that involve various generalized curvature tensors. In sect.5 we study conformally harmonic  $(WZS)_n$  and obtain the explicit form of the Ricci tensor. In the conformally flat case we also give the local form of the metric.

#### 2. General properties

From the definition of a  $(WZS)_n$  and its symmetries we obtain

(8) 
$$0 = \eta_j Z_{kl} - \eta_l Z_{kj},$$

(9)  $\nabla_k Z_{jl} - \nabla_j Z_{kl} = \omega_k Z_{jl} - \omega_j Z_{kl},$ 

with covectors

(10)

$$\eta = B - D, \qquad \omega = A - B$$

that will be used throughout.

Let's consider eq.(8) first, it implies the following statements:

**Proposition 2.1.** In a  $(WZS)_n$ , if the Z tensor is non-singular then  $\eta_k = 0$ .

*Proof.* If the Z tensor is non singular, there exists a (2,0) tensor  $Z^{-1}$  such that  $(Z^{-1})^{kh}Z_{kl} = \delta^h{}_l$ . By transvecting eq.(8) with  $(Z^{-1})^{kh}$  we obtain  $\eta_j\delta_l{}^h = \eta_l\delta_j{}^h$ ; put h = l and sum to obtain  $(n-1)\eta_j = 0$ .

**Proposition 2.2.** If  $\eta_k \neq 0$  and the scalar  $Z \neq 0$ , then the Z tensor has rank one:

(11) 
$$Z_{ij} = Z \frac{\eta_i \eta_j}{\eta^k \eta_k}$$

*Proof.* Multiply eq.(8) by  $\eta^j$  and sum:  $\eta^j \eta_j Z_{kl} = \eta_l \eta^j Z_{kj}$ . Multiply eq.(8) by  $g^{jk}$  and sum:  $\eta^k Z_{kl} = Z \eta_l$ . The two results imply the assertion.

The result translates to the Ricci tensor, whose expression is characteristic of *quasi Einstein* Riemannian manifolds [7], and generalizes the results of [12]:

**Proposition 2.3.** A  $(WZS)_n$  with  $\eta_k \neq 0$ , is a quasi Einstein manifold:

(12) 
$$R_{ij} = -\phi g_{ij} + Z T_i T_j, \qquad T_i = \frac{\eta_i}{\|\eta\|},$$

Next we consider eq.(9). If  $Z_{ij}$  is a Codazzi tensor, then the l.h.s. of the equation vanishes by definition, and the above discussion of eq.(8) can be repeated. We merely state the result:

**Proposition 2.4.** In a  $(WZS)_n$  with a Codazzi Z tensor, if Z is singular then  $\omega_k \neq 0$ . Conversely, if rank  $[Z_{kl}] > 1$  then  $\omega_k = 0$ .

3. Harmonic conformal or quasi conformal (WZS)<sub>n</sub> with  $\eta \neq 0$ 

In this section we consider manifolds  $(WZS)_n$  (n > 3) with  $\eta_k \neq 0$ , and the property  $\nabla_m C_{jkl}{}^m = 0$  (i.e. harmonic conformal curvature tensor [3]) or  $\nabla_m W_{jkl}{}^m = 0$ (i.e. harmonic quasi conformal curvature tensor [34]). We provide sufficient conditions for  $\eta/||\eta||$  to be a proper concircular vector [28, 32].

We begin with the case of harmonic conformal tensor. From the expression for the divergence of the conformal tensor,

(13) 
$$\nabla_m C_{jkl}{}^m = \frac{n-3}{n-2} \left[ \nabla_k R_{jl} - \nabla_j R_{kl} + \frac{1}{2(n-1)} (g_{kl} \nabla_j - g_{jl} \nabla_k) R \right]$$

we read the condition  $\nabla_m C_{jkl}{}^m = 0$ :

(14) 
$$\nabla_k R_{jl} - \nabla_j R_{kl} = \frac{1}{2(n-1)} (g_{jl} \nabla_k - g_{kl} \nabla_j) R.$$

We need the following theorem, whose proof given here is different from that in [13] (see also [10]):

**Theorem 3.1.** Let M be a n > 3 dimensional manifold, with harmonic conformal curvature tensor, and Ricci tensor  $R_{kl} = \alpha g_{kl} + \beta T_k T_l$ , where  $\alpha$ ,  $\beta$  are scalars, and  $T^k T_k = 1$ . If

(15) 
$$(T_j \nabla_k - T_k \nabla_j)\beta = 0$$

then  $T_k$  is a proper concircular vector.

*Proof.* Since M is conformally harmonic, eq.(14) gives:

(16) 
$$\beta[\nabla_k(T_jT_l) - \nabla_j(T_kT_l)] = \frac{1}{2(n-1)}(g_{jl}\nabla_k - g_{kl}\nabla_j)S,$$

where  $S = -(n-2)\alpha + \beta$ , and condition (15) was used. The proof is in four steps. 1) We show that  $T^l \nabla_l T_k = 0$ : multiply eq.(16) by  $g^{jl}$  to obtain: a)  $-\beta \nabla^l (T_k T_l) = \frac{1}{2} \nabla_k S$ . The result a) is multiplied by  $T^k$  to give: b)  $-\beta \nabla_l T^l = \frac{1}{2} T^l \nabla_l S$ . a) and b) combine to give: c)  $-\beta T^l \nabla_l T_k = \frac{1}{2} [\nabla_k - T_k T^l \nabla_l] S$ . Finally multiply eq.(16) by  $T^k T^l$  and use the property  $T^l \nabla_k T_l = 0$  to obtain:

$$\beta T^k \nabla_k T_j = \frac{1}{2(n-1)} (T_j T^k \nabla_k - \nabla_j) S$$

which, compared to c) shows that d)  $T^l \nabla_l T_k = 0$  and  $(T_j T^k \nabla_k - \nabla_j) S = 0$ . 2) We show that T is a closed 1-form: multiply eq.(16) by  $T^l$ 

$$\beta[\nabla_k T_j - \nabla_j T_k] = \frac{1}{2(n-1)} (T_j \nabla_k - T_k \nabla_j) S_j$$

T is a closed form if the r.h.s. is null. This is proven by using identity a) to write:  $(T_j \nabla_k - T_k \nabla_j) S = -2\beta [T_j \nabla^l (T_k T_l) - T_k \nabla^l (T_j T_l)] = 0$  by property d). 3) With condition d) in mind, transvect eq.(16) with  $T^k$  and obtain

$$-\beta \nabla_j T_l = \frac{1}{2(n-1)} (g_{jl} T^k \nabla_k - T_l \nabla_j) S$$

Use d) to replace  $T_l \nabla_j S$  with  $T_l T_j T^k \nabla_k S$ . Then:

(17) 
$$\nabla_j T_l = f \left( T_j T_l - g_{jl} \right), \quad f \equiv \frac{T^k \nabla_k S}{2\beta(n-1)}$$

which means that  $T_k$  is a concircular vector.

4) We prove that  $T_k$  is a proper concircular vector, i.e.  $fT_k$  is a closed 1-form: from d) by a covariant derivative we obtain  $\nabla_j \nabla_k S = (\nabla_j T_k)(T^l \nabla_l S) + T_k \nabla_j (T^l \nabla_l S)$ ; subtract same equation with indices k and j exchanged. Since  $T_k$  is a closed 1-form we obtain:  $T_k \nabla_j (T^l \nabla_l S) = T_j \nabla_k (T^l \nabla_l S)$ . Multiply by  $T^k$ :

$$(T_j T^k \nabla_k - \nabla_j) (T^l \nabla_l S) = 0$$

From the relation (15), one obtains:  $(T_k T^l \nabla_l - \nabla_k)\beta = 0$ . It follows that the scalar function f has the property  $\nabla_j f = \mu T_j$  where  $\mu$  is a scalar function. Then the 1-form  $fT_k$  is closed.

With the identifications  $\alpha = -\phi$  and  $\beta = Z$ ,  $T_i = \eta_i / ||\eta||$  (see Prop. 2.3) the condition (15) is  $(\eta_j \nabla_k - \eta_k \nabla_j) Z = 0$ . Since  $Z = S - (n-2)\phi$  and  $(\eta_j \nabla_k - \eta_k \nabla_j) S = 0$ , the condition can be rewritten as  $(\eta_j \nabla_k - \eta_k \nabla_j)\phi = 0$ . Thus we can state the following:

**Theorem 3.2.** In a  $(WZS)_n$  manifold with  $\eta_k \neq 0$  and harmonic conformal curvature tensor, if

(18) 
$$(\eta_j \nabla_k - \eta_k \nabla_j) \phi = 0$$

then  $\eta_i / \|\eta\|$  is a proper concircular vector.

**Remark 1.** If  $\phi = 0$  or  $\nabla_k \phi = 0$ , the condition (18) is fulfilled automatically. In the case  $\phi = 0$  we recover a  $(WRS)_n$  manifold (and the results of refs [10, 12]).

Now we consider the case of a  $(WZS)_n$  manifold with harmonic quasi conformal curvature tensor. In 1968 Yano and Sawaki [34] defined and studied a tensor  $W_{jkl}{}^m$  on a Riemannian manifold of dimension n > 3, which includes as particular cases the conformal curvature tensor  $C_{jkl}{}^m$ , eq.(2), and the concircular curvature tensor

(19) 
$$\tilde{C}_{jkl}{}^m = R_{jkl}{}^m + \frac{R}{n(n-1)} (\delta_j{}^m g_{kl} - \delta_k{}^m g_{jl}).$$

The tensor is known as the *quasi conformal* curvature tensor:

(20) 
$$W_{jkl}{}^m = -(n-2) b C_{jkl}{}^m + [a+(n-2)b] \tilde{C}_{jkl}{}^m;$$

a and b are nonzero constants. From the expressions (13) and (33) we evaluate

(21) 
$$\nabla_m W_{jkl}{}^m = (a+b)\nabla_m R_{jkl}{}^m + \frac{2a-b(n-1)(n-4)}{2n(n-1)}(g_{kl}\nabla_j - g_{jl}\nabla_k)R.$$

A manifold is quasi conformally harmonic if  $\nabla_m W_{jkl}{}^m = 0$ . By transvecting the condition with  $g^{jk}$  we get:

(22) 
$$(1-2/n)[a+b(n-2)] \nabla_i R = 0,$$

which means that either a + b(n-2) = 0 or  $\nabla_j R = 0$ . The first condition implies W = C, and gives back the harmonic conformal case. If  $\nabla_j R = 0$  it is  $\nabla_m R_{jkl}{}^m = 0$  by (21), and the equations in the proof of theorem 3.1 simplify and we can state the following (analogous to theorem 3.2):

**Theorem 3.3.** Let  $(WZS)_n$  be a quasi conformally harmonic manifold, with  $\eta_k \neq 0$ . If  $(\eta_j \nabla_k - \eta_k \nabla_j) \phi = 0$ , then  $\eta/||\eta||$  is a proper concircular vector.

4.  $(WZS)_n$  with non-singular Z tensor: conditions for closed  $\omega$ 

In this section we investigate in a  $(WZS)_n$  (n > 3) the conditions the 1-form  $\omega_k$  to be closed:  $\nabla_i \omega_j - \nabla_j \omega_i = 0$ . We need:

**Lemma 4.1** (Lovelock's differential identity, [23, 24]). In a Riemannian manifold the following identity is true:

(23) 
$$\nabla_i \nabla_m R_{jkl}{}^m + \nabla_j \nabla_m R_{kil}{}^m + \nabla_k \nabla_m R_{ijl}{}^m = -R_{im} R_{jkl}{}^m - R_{jm} R_{kil}{}^m - R_{km} R_{ijl}{}^m$$

and also the contracted second Bianchi identity in the form

(24) 
$$\nabla_m R_{jkl}{}^m = \nabla_k Z_{jl} - \nabla_j Z_{kl} + (g_{kl} \nabla_j - g_{jl} \nabla_k)\phi$$

Now we prove the relevant theorem (see also [24]):

**Theorem 4.2.** In a  $(WZS)_n$  (n > 3) with non singular Z tensor,  $\omega_k$  is a closed 1-form if and only if:

(25) 
$$R_{im}R_{jkl}{}^m + R_{jm}R_{kil}{}^m + R_{km}R_{ijl}{}^m = 0.$$

*Proof.* The covariant derivative of eq.(24) and eq.(9) give:  $\nabla_i \nabla_m R_{jkl}{}^m = (\nabla_i \omega_k) Z_{jl} + \omega_k (\nabla_i Z_{jl}) - (\nabla_i \omega_j) Z_{kl} - \omega_j (\nabla_i Z_{kl}) + (g_{kl} \nabla_i \nabla_j \phi - g_{jl} \nabla_i \nabla_k \phi)$ . Cyclic permutations of the indices i, j, k are made, and the resulting three equations are added:

$$\begin{aligned} \nabla_i \nabla_m R_{jkl}{}^m + \nabla_j \nabla_m R_{kil}{}^m + \nabla_k \nabla_m R_{ijl}{}^m \\ &= (\nabla_i \omega_k - \nabla_k \omega_i) Z_{jl} + (\nabla_j \omega_i - \nabla_i \omega_j) Z_{kl} + (\nabla_k \omega_j - \nabla_j \omega_k) Z_{il} \\ &+ \omega_j (\nabla_k Z_{il} - \nabla_i Z_{kl}) + \omega_k (\nabla_i Z_{jl} - \nabla_j Z_{il}) + \omega_i (\nabla_j Z_{kl} - \nabla_k Z_{jl}). \end{aligned}$$

Cancellations occur by eq.(9). By lemma 4.1, one obtains:

$$-R_{im}R_{jkl}{}^m - R_{jm}R_{kil}{}^m - R_{km}R_{ijl}{}^m$$
  
=  $(\nabla_i\omega_k - \nabla_k\omega_i)Z_{jl} + (\nabla_j\omega_i - \nabla_i\omega_j)Z_{kl} + (\nabla_k\omega_j - \nabla_j\omega_k)Z_{il}.$ 

If  $\omega_k$  is a closed 1-form then eq.(25) is fulfilled. Conversely, suppose that eq.(25) holds: if the Z tensor is non singular, there is a (2,0) tensor such that  $Z_{kl}(Z^{-1})^{km} = \delta_l^m$ . Multiply the last equation by  $(Z^{-1})^{hl}$ :  $(\nabla_i \omega_k - \nabla_k \omega_i) \delta_j^h + (\nabla_j \omega_i - \nabla_i \omega_j) \delta_k^h + (\nabla_k \omega_j - \nabla_j \omega_k) \delta_i^h = 0$ . Set h = j and sum:  $(n-2)(\nabla_i \omega_k - \nabla_k \omega_i) = 0$ . Since  $n > 2, \omega_k$  is a closed 1-form.

**Remark 2.** By Lovelock's identity, the condition (25) is obviously true if  $\nabla_m R_{ijk}^m = 0$ , i.e. the  $(WZS)_n$  is a harmonic manifold. However, we have shown in ref.[24] that there is a broad class of generalized curvature tensors for which the case  $\nabla_m K_{ijk}^m = 0$  implies the same condition. This class includes several well known curvature tensors, and is the main subject of this section.

**Definition 4.3.** A tensor  $K_{jkl}{}^m$  is a generalized curvature tensor<sup>1</sup> if: 1)  $K_{jkl}{}^m = -K_{kjl}{}^m$ , 2)  $K_{jkl}{}^m + K_{klj}{}^m + K_{ljk}{}^m = 0$ .

The second Bianchi identity does not hold in general, and is modified by a tensor source  $B_{ijkl}^{m}$  that depends on the specific form of the curvature tensor:

(26) 
$$\nabla_i K_{jkl}{}^m + \nabla_j K_{kil}{}^m + \nabla_k K_{ijl}{}^m = B_{ijkl}{}^n$$

**Proposition 4.4** ([24]). If  $K_{jkl}^{m}$  is a generalized curvature tensor such that

(27) 
$$\nabla_m K_{jkl}{}^m = A \nabla_m R_{jkl}{}^m + B(a_{lk} \nabla_j - a_{lj} \nabla_k) \psi$$

where  $A \neq 0$ , B are constants,  $\psi$  is a scalar field, and  $a_{ij}$  is a symmetric (0,2) Codazzi tensor (i.e.  $\nabla_i a_{kl} = \nabla_k a_{il}$ ), then the following relation holds:

(28) 
$$\nabla_i \nabla_m K_{jkl}{}^m + \nabla_j \nabla_m K_{kil}{}^m + \nabla_k \nabla_m K_{ijl}{}^m$$
$$= -A(R_{im}R_{jkl}{}^m + R_{jm}R_{kil}{}^m + R_{km}R_{ijl}{}^m)$$

**Remark 3.** In [16] it is proven that any smooth manifold carries a metric such that (M, g) admits a non trivial Codazzi tensor (i.e. proportional to the metric tensor) and the deep consequences on the structure of the curvature operator are presented (see also [25]).

Given a Codazzi tensor it is possible to exhibit a K tensor that satisfies the condition (27):

(29) 
$$K_{jkl}{}^m = A R_{jkl}{}^m + B \psi \left(\delta_j{}^m a_{kl} - \delta_k{}^m a_{jl}\right).$$

Its trace is:  $K_{kl} = -K_{mkl}{}^m = A R_{kl} - B(n-1)\psi a_{kl}$ . Note that for  $a_{kl} = g_{kl}$  the tensor  $K_{kl}$  is up to a factor a Z tensor. Thus Z tensors arise naturally from the invariance of Lovelock's identity.

**Remark 4.** In the literature one meets generalized curvature tensors whose divergence has the form (27), with trivial Codazzi tensor:

(30) 
$$\nabla_m K_{jkl}{}^m = A \nabla_m R_{jkl}{}^m + B(g_{kl}\nabla_j - g_{jl}\nabla_k)R.$$

They are the projective curvature tensor  $P_{jkl}^m$  [18], the conformal curvature tensor  $C_{jkl}^m$  [27], the concircular tensor  $\tilde{C}_{jkl}^m$  [28, 32], the conharmonic tensor  $N_{jkl}^m$  [26, 30] and the quasi conformal tensor  $W_{jkl}^m$  [34].

**Definition 4.5.** A manifold is *K*-harmonic if  $\nabla_m K_{jkl}^m = 0$ .

**Proposition 4.6.** In a K-harmonic manifold, if K is of type (30) and  $A \neq 2(n-1)B$ , then  $\nabla_{i}R = 0$ .

*Proof.* By transvecting eq.(30) with  $g^{kl}$  and by the second contracted Bianchi identity, we obtain  $\frac{1}{2}[A - 2(n-1)B]\nabla_j R = 0$ .

 $<sup>^{1}</sup>$ The notion was introduced by Kobayashi and Nomizu [22], but with the further antisymmetry in the last pair of indices.

Hereafter, we specialize to  $(WZS)_n$  manifolds with non singular Z tensor, and with a generalized curvature tensor of the type (30). From eqs. (24) and (9) we obtain:

(31) 
$$\nabla_m K_{jkl}{}^m = A(\omega_k Z_{jl} - \omega_j Z_{kl}) + (g_{kl} \nabla_j - g_{jl} \nabla_k)(A\phi + BR).$$

Then, the manifold is K-harmonic if:

(32) 
$$A(\omega_k Z_{jl} - \omega_j Z_{kl}) = (g_{jl} \nabla_k - g_{kl} \nabla_j) (A\phi + BR).$$

**Lemma 4.7.** In a K-harmonic  $(WZS)_n$  with non singular Z tensor: 1)  $\omega_k = 0$  if and only if  $\nabla_k(A\phi + BR) = 0$ ; 2) If  $A \neq 2(n-1)B$ , then  $\omega_k = 0$  if and only if  $\nabla_k \phi = 0$ .

Proof. If  $\nabla_k (A\phi + BR) = 0$  then  $\omega_k Z_{jl} = \omega_j Z_{kl}$ : if the Z tensor is non singular, by transvecting with  $(Z^{-1})^{lh}$  we obtain  $\omega_j \delta^h{}_k = \omega_k \delta^h{}_j$ . Now put h = j and sum to obtain  $(n-1)\omega_k = 0$ . On the other hand if  $\omega_k = 0$  eq.(32) gives  $[g_{jl}\nabla_k - g_{kl}\nabla_j](A\phi + BR) = 0$  and transvecting with  $g^{kl}$  we get the result. If  $A \neq 2B(n-1)$  then  $\nabla_k R = 0$  and part 1) applies.

**Theorem 4.8.** In a K-harmonic  $(WZS)_n$  with non-singular Z tensor and K of type (30), if  $\omega \neq 0$  then  $\omega$  is a closed 1-form.

This theorem extends theorem 4.2 (where K = R), and has interesting corollaries according to the various choices  $K = C, W, P, \tilde{C}, N$ .

**Corollary 4.9.** Let  $(WZS)_n$  have non singular Z tensor and  $\omega \neq 0$ . If  $\nabla_m K_{jkl}^m = 0$ , and  $K = P, \tilde{C}, N$ , then  $\omega$  is a closed 1-form.

*Proof.* 1) Harmonic conformal curvature:  $\nabla_m C_{jkl}{}^m = 0$ . Note that in this case A = 2B(n-1); theorem 4.8 applies.

2) Harmonic quasi conformal curvature:  $\nabla_m W_{jkl}{}^m = 0$ : Eq.(22) gives either  $\nabla_j R = 0$  or a + b(n-2) = 0. If  $\nabla_j R = 0$  then  $\nabla_m R_{jkl}{}^m = 0$  and theorem 4.2. If a + b(n-2) = 0 it is  $\nabla_m C_{jkl}{}^m = 0$  and case 1) applies.

3) Harmonic projective curvature:  $\nabla_m P_{jkl}{}^m = 0$ . The components of the projective curvature tensor are [18, 30]:

$$P_{jkl}{}^{m} = R_{jkl}{}^{m} + \frac{1}{n-1} (\delta_{j}{}^{m}R_{kl} - \delta_{k}{}^{m}R_{jl}).$$

One evaluates  $\nabla_m P_{jkl}{}^m = \frac{n-2}{n-1} \nabla_m R_{jkl}{}^m$ , and theorem 4.2 applies.

4) Harmonic concircular curvature:  $\nabla_m \hat{C}_{jkl}{}^m = 0$ . The concircular curvature tensor is given in eq.(19), [28, 32]. Its divergence is

(33) 
$$\nabla_m \tilde{C}_{jkl}{}^m = \nabla_m R^m_{jkl} + \frac{1}{n(n-1)} (g_{kl} \nabla_j - g_{jl} \nabla_k) R$$

Theorem 4.8 applies.

5) Harmonic conharmonic curvature:  $\nabla_m N_{jkl}{}^m = 0$ . The conharmonic curvature tensor [26, 30] is:

$$N_{jkl}{}^{m} = R_{jkl}{}^{m} + \frac{1}{n-2} (\delta_{j}{}^{m}R_{kl} - \delta_{k}{}^{m}R_{jl} + R_{j}{}^{m}g_{kl} - R_{k}{}^{m}g_{jl}).$$

A covariant derivative and the second contracted Bianchi identity give:

$$\nabla_m N_{jkl}{}^m = \frac{n-3}{n-2} \nabla_m R_{jkl}{}^m + \frac{1}{2(n-2)} (g_{kl} \nabla_j - g_{jl} \nabla_k) R.$$

Theorems 4.8 applies.

There are other cases where the 1-form  $\omega_k$  is closed for a  $(WZS)_n$  manifold.

**Definition 4.10** ([24, 21]). A *n*-dimensional Riemannian manifold is *K*-recurrent,  $(KR)_n$ , if the generalized curvature tensor is recurrent,  $\nabla_i K_{jkl}^m = \lambda_i K_{jkl}^m$ , for some non zero covector  $\lambda_i$ .

**Theorem 4.11** ([24]). In a  $(KR)_n$ , if  $\lambda_i$  is closed then:

(34) 
$$R_{im}R_{jkl}{}^m + R_{jm}R_{kil}{}^m + R_{km}R_{ijl}{}^m = -\frac{1}{A}\nabla_m B_{ijkl}{}^m.$$

where B is the source tensor in eq.(26). In particular, for  $K = C, P, \tilde{C}, N, W$  the tensor  $\nabla_m B_{ijkl}{}^m$  either vanishes or is proportional to the l.h.s. of eq.(34).

**Corollary 4.12.** Let  $(WZS)_n$  have non singular Z tensor, and be K recurrent with closed  $\lambda_i$ . If  $K = C, P, \tilde{C}, N, W$ , then  $\omega$  is a closed 1-form.

**Definition 4.13.** A Riemannian manifold is *pseudosymmetric in the sense of* R. Deszcz [17] if the following condition holds:

$$(\nabla_s \nabla_i - \nabla_i \nabla_s) R_{jklm} = L_R \left( g_{js} R_{iklm} - g_{ji} R_{sklm} + g_{ks} R_{jilm} - g_{ki} R_{jslm} \right)$$
  
(35) 
$$+ g_{ls} R_{jkim} - g_{li} R_{jksm} + g_{ms} R_{jkli} - g_{mi} R_{jkls},$$

where  $L_R$  is a non null scalar function.

In ref.[24] the following theorem is proven:

**Theorem 4.14.** In a Riemannian manifold which is pseudosymmetric in the sense of R. Deszcz, it is  $R_{im}R_{jkl}^{\ m} + R_{jm}R_{kil}^{\ m} + R_{km}R_{ijl}^{\ m} = 0.$ 

Then we can state the following:

**Proposition 4.15.** In a  $(WZS)_n$  which is pseudosymmetric in the sense of R. Deszcz, if the Z tensor is non-singular then  $\omega_k$  is a closed 1-form.

**Definition 4.16.** A Riemannian manifold is generalized Ricci pseudosymmetric in the sense of R. Deszcz, [15], if the following condition holds:

$$(\nabla_s \nabla_i - \nabla_i \nabla_s) R_{jklm} = L_S (R_{js} R_{iklm} - R_{ji} R_{sklm} + R_{ks} R_{jilm} - R_{ki} R_{jslm} +$$

 $(36) +R_{ls}R_{jkim} - R_{li}R_{jksm} + R_{ms}R_{jkli} - R_{mi}R_{jkls}),$ 

where  $L_S$  is a non null scalar function.

**Theorem 4.17.** In a generalized Ricci pseudosymmetric manifold in the sense of R. Deszcz, it is either  $L_S = -\frac{1}{3}$ , or  $R_{im}R_{jkl}{}^m + R_{jm}R_{kil}{}^m + R_{km}R_{ijl}{}^m = 0$ .

*Proof.* Equation (36) is transvected with  $g^{mj}$  to obtain

$$(\nabla_s \nabla_i - \nabla_i \nabla_s) R_{kl} = L_S[R_{im}(R_{skl}^m + R_{slk}^m) - R_{sm}(R_{ikl}^m + R_{ilk}^m)].$$

Then:

$$(\nabla_i \nabla_k - \nabla_k \nabla_i) R_{jl} + (\nabla_j \nabla_i - \nabla_i \nabla_j) R_{kl} + (\nabla_k \nabla_j - \nabla_j \nabla_k) R_{il}$$
  
=  $3L_S(R_{im} R_{jkl}^m + R_{jm} R_{kil}^m + R_{km} R_{ijl}^m)$ 

By Lovelock's identity (4.1), the l.h.s. of the previous equation is:

$$\nabla_i \nabla_m R_{jkl}{}^m + \nabla_j \nabla_m R_{kil}{}^m + \nabla_k \nabla_m R_{ijl}{}^m$$
  
=  $(\nabla_i \nabla_k - \nabla_k \nabla_i) R_{jl} + (\nabla_j \nabla_i - \nabla_i \nabla_j) R_{kl} + (\nabla_k \nabla_j - \nabla_j \nabla_k) R_{il}$   
=  $-R_{im} R_{jkl}{}^m - R_{jm} R_{kil}{}^m - R_{km} R_{ijl}{}^m$ .

Compare the two results and conclude that either  $L_S = -\frac{1}{3}$ , or  $R_{im}R_{jkl}^m + R_{jm}R_{kil}^m + R_{km}R_{ijl}^m = 0$ .

Finally we state:

**Proposition 4.18.** In a  $(WZS)_n$  which is also a generalized Ricci pseudosymmetric manifold in the sense of R.Deszcz, if the Z tensor is non-singular and  $L_S \neq -\frac{1}{3}$ , then  $\omega_k$  is a closed 1-form.

# 5. Conformally harmonic $(WZS)_n$ : form of the Ricci tensor

In this section we study conformally harmonic  $(WZS)_n$  in depth. We show the existence of a proper concircular vector in such manifolds, and obtain the form of the Ricci tensor. The proof only requires the Z tensor to be non singular. For the conformally flat case, in particular, we give the explicit local form of the metric tensor.

The condition  $\nabla_m C_{jkl}{}^m = 0$  is eq.(14) which, by using  $R_{ij} = Z_{ij} - g_{ij} \phi$  and the property eq.(9), becomes:

(37) 
$$\omega_k Z_{jl} - \omega_j Z_{kl} = \frac{1}{2(n-1)} (g_{jl} \nabla_k - g_{kl} \nabla_j) [R + 2(n-1)\phi].$$

This is the starting point for the proofs. By prop 4.7, since Z is non singular,  $\omega_k \neq 0$  if and only if  $\nabla_k [R + 2(n-1)\phi] \neq 0$ .

**Remark 5.** 1) The condition  $\nabla_m C_{jkl}{}^m = 0$  implies that the manifold is a  $(NCS)_n$ . 2) If  $\nabla_k [R+2(n-1)\phi] = 0$  the Z tensor is a Codazzi tensor.

The following theorem generalizes a result in [11] for  $A(PRS)_n$ :

**Theorem 5.1.** In a conformally harmonic  $(WZS)_n$  the 1-form  $\omega$  is an eigenvector of the Z tensor.

*Proof.* By transvecting eq.(37) with  $g^{kl}$  we obtain

(38) 
$$\omega_j Z - \omega^m Z_{jm} = \frac{1}{2} \nabla_j [R + 2(n-1)\phi];$$

the result is inserted back in eq.(37),

$$\omega_k Z_{jl} - \omega_j Z_{kl} = \frac{1}{(n-1)} [(\omega_k Z - \omega^m Z_{km})g_{jl} - (\omega_j Z - \omega^m Z_{jm})g_{kl}],$$

and transvected with  $\omega^j \omega^l$  to obtain  $\omega_k(\omega^j \omega^l Z_{jl}) = (\omega_j \omega^j) \omega^l Z_{kl}$ . The last equation can be rewritten as:  $Z_{kl} \omega^l = \zeta \omega_k$ 

Now eq.(38) simplifies:  $\omega_j(\zeta - Z) = -\frac{1}{2}\nabla_j[R + 2(n-1)\phi]$ . The result is a natural generalization of a similar one given in ref.[11] for  $A(PRS)_n$ .

**Theorem 5.2.** Let M be a conformally harmonic  $(WZS)_n$ . Then: 1) M is a quasi Einstein manifold;

2) if the Z tensor is non singular and if  $(\omega_j \nabla_k - \omega_k \nabla_j)\phi = 0$ , then:

(39) 
$$(\omega_j \nabla_k - \omega_k \nabla_j) \left[ \frac{n\zeta - Z}{n-1} \right] = 0,$$

and M admits a proper concircular vector.

10

*Proof.* Eq.(37) is transvected with  $\omega^{j}$  and theorem 5.1 is used to show that

$$R_{kl} = \left[\frac{Z-\zeta}{n-1} - \phi\right] g_{kl} + \left[\frac{n\zeta-Z}{n-1}\right] \frac{\omega_k \omega_l}{\omega_j \omega^j},$$

i.e.  $R_{kl}$  has the structure  $\alpha g_{kl} + \beta T_k T_l$  and the manifold is quasi Einstein [7]. By transvecting eq.(24) with  $g^{jl}$  we obtain

$$\frac{1}{2}\nabla_k Z + \frac{n-2}{2}\nabla_k \phi = \omega_k Z - \omega^l Z_{kl}.$$

This and theorem (5.1) imply:

(40) 
$$\frac{1}{2}\nabla_k Z + \frac{n-2}{2}\nabla_k \phi = \omega_k (Z - \zeta).$$

A covariant derivative gives  $\frac{1}{2}\nabla_j\nabla_k Z + \frac{n-2}{2}\nabla_j\nabla_k \phi = \nabla_j[\omega_k(Z-\zeta)]$ . Subtract the equation with indices k and j exchanged:

$$(Z-\zeta)(\nabla_j\omega_k-\nabla_k\omega_j)+(\omega_k\nabla_j-\omega_j\nabla_k)(Z-\zeta)=0.$$

According to corollary 4.9, in a conformally harmonic  $(WZS)_n$  with non singular Z the 1-form  $\omega_k$  is closed. Then

(41) 
$$(\omega_k \nabla_j - \omega_j \nabla_k)(Z - \zeta) = 0$$

Multiply eq.(40) by  $\omega_j$  and subtract from it the equation with indices k and j exchanged:  $(\omega_j \nabla_k - \omega_k \nabla_j)Z + (n-2)(\omega_j \nabla_k - \omega_k \nabla_j)\phi = 0$ . Suppose that  $\omega_k$ , besides being a closed 1-form, has the property  $(\omega_j \nabla_k - \omega_k \nabla_j)\phi = 0$ , then one obtains the further equation:

(42) 
$$(\omega_k \nabla_j - \omega_j \nabla_k) Z = 0$$

Eqs.(41,42) imply the assertion eq.(39). The existence of a proper concircular vector follows from Theorem 3.1.  $\Box$ 

Let us specialize to the case  $C_{ijk}{}^m = 0$  (conformally flat  $(WZS)_n$ ). It is well known [1] that if a conformally flat space admits a proper concircular vector, then the space is subprojective in the sense of Kagan. From theorem 5.2 we state the following:

**Theorem 5.3.** Let  $(WZS)_n$  (n > 3) be conformally flat with nonsingular Z tensor and  $(\omega_j \nabla_k - \omega_k \nabla_j) \phi = 0$ , then the manifold is a subprojective space.

In [33] K. Yano proved that a necessary and sufficient condition for a Riemannian manifold to admit a concircular vector, is that there is a coordinate system in which the first fundamental form may be written as:

(43) 
$$ds^{2} = (dx^{1})^{2} + e^{q(x^{1})}g_{\alpha\beta}^{*}(x^{2},\dots,x^{n})dx^{\alpha}dx^{\beta},$$

where  $\alpha, \beta = 2, ..., n$ . Since a conformally flat  $(WZS)_n$  with non singular Z tensor admits a proper concircular vector field, this space is the warped product  $1 \times e^q M^*$ , where  $(M^*, g^*)$  is a (n - 1)-dimensional Riemannian manifold. Gebarosky [19] proved that the warped product  $1 \times e^q M^*$  has the metric structure (43) if and only if  $M^*$  is Einstein. Thus the following theorem holds:

**Theorem 5.4.** Let M be a n dimensional conformally flat  $(WZS)_n$  (n > 3). If  $Z_{kl}$  is non singular and  $(\omega_j \nabla_k - \omega_k \nabla_j)\phi = 0$ , then M is the warped product  $1 \times e^q M^*$ , where  $M^*$  is Einstein.
